

The figure displays a network graph visualization. The central node is a large black circle labeled "H. Garahan". This central node is connected to a large number of other nodes, which are represented by smaller circles. Some of these peripheral nodes are also black, while others are white. The graph is composed of several distinct clusters or communities, each with its own internal structure of connections. The clusters are distributed across the plot area, which has x and y axes ranging from -40 to 40. The overall structure suggests a highly connected central hub with multiple smaller, interconnected groups of nodes.
